RCCM: RC/YAO/2006/B/945 — amendment RC/YAO/2007/M/328 · NIU: M01060001983W · Capital: 10,000,000 FCFA

1. The manifesto — the spirit of the model

Before being a method, PACTE is a doctrine. Three simple laws capture its spirit, before they are translated into five operational functions.

Produce for Demand

Agriculture must no longer move forward blindly, driven by habit. It must listen to the market — consumers, industries — to know what to produce, in what quantity, at what time and to what quality standard.

Transform for Value

Producing is not enough. Wealth is born from the ability to raise raw material into something more useful and more durable: from the raw to the precious, from the local to the competitive.

Export for Impact

A sector that looks only at its own territory ends up going in circles. Exporting means confronting production with international demand and bringing back revenue and deep transformation.

"This is not a slogan. It is an architecture — a way of thinking, acting and governing the agricultural sector with **intelligence, clarity and ambition.**"

Methodological note — FCFA. CAPEX, OPEX and revenue projections for a given Hub or value chain are set out in a dedicated business plan, built chain by chain and expressed in FCFA with its own assumptions. This framework addresses the strategic coherence of the model; it does not prejudge the financial parameters of any specific project.

2. The PACTE model — a value-circulation architecture

"Money is born in the market and must flow back to the producer — and to the territory — through an organised, legible and high-performing value chain."

PACTE translates the doctrine into five complementary functions organised as a value chain. Each stakeholder knows what they contribute to the system, what they draw from it, and how their contribution strengthens overall value. This reciprocity replaces a passive value chain with a negotiated one — the condition of its long-term sustainability.

Articulation with the XP-NOVA method. PACTE is the sector model; its delivery follows the 6-phase engineering method (Understand → Design → Structure → Execute → Sustain → Measure impact), which secures every step of the value-chain project.

3. The five pillars in detail

P**Produce — secure and professionalise the productive base**

Make labour, regularity and baseline quality the first guarantee of the value chain.

Levers: frugal, shared mechanisation · certified Agro-Practitioner status · access to inputs · local technical and animal-health support · modern technical itineraries.

A**Aggregate — bring together into a structured economic force**

Turn an atomised supply into consolidated, legible and negotiable volumes.

Levers: reformed cooperatives · collection Hubs (centralise, weigh, certify volumes) · land and territorial securing · collective discipline and quality control.

C**Commercialise — connect to pre-identified solvent demand**

Sell under contract rather than in uncertainty, on volumes and prices negotiated upstream.

Levers: off-taker contracting · market-information access · regional (AfCFTA) and international outlets.

T**Transform — capture value close to the production basin**

Raise raw material into a finished or semi-finished product, cut losses and stabilise the input.

Levers: transformation and pre-conditioning Hubs · cold chain · abattoirs · digital traceability and geolocation.

E**Export — access markets with compliant products**

Make the traceability built from the upstream the strongest commercial argument for demanding markets.

Levers: EUDR compliance (European Union) · HACCP · ISO 22000 · certification and origin documentation.

4. The PACTE Hub — the pivot infrastructure

The Hub is the physical and digital link that materialises aggregation and first transformation close to the production basin. It reduces the volume to transport, stabilises the raw material, lowers the factory-delivered logistics cost and builds the traceability required for export.

Collection & weighing centralising volumes from many producers	Sorting & certification quality control, grading, lot certification	Pre-processing conditioning, first transformation, cold chain	Digital traceability geolocation, origin, EUDR/ HACCP compliance
--	---	---	--

The value journey — five steps

Step	Pillar	What happens
1	Produce	Producers and livestock keepers grow and raise according to modern technical itineraries.
2	Aggregate	Cooperatives collect, sort and centralise the volumes of many producers.
3	Commercialise	Brokers, buyers and importers contract volumes and prices on the aggregated production.
4	Transform	Processors raise the raw material into a finished or semi-finished, more competitive product.
5	Export	The compliant product reaches local, regional and international markets; money flows back to the producer.

From field to market, then from market to producer: the organised circulation of value.

5. The eight stakeholder families — shared value

Each stakeholder makes a specific contribution and draws a differentiated benefit. This reciprocity makes the model sustainable over time.

Stakeholder	What they contribute	What they receive	Impact generated
Producers / livestock keepers	Labour, production, regularity, baseline quality.	Fairer price, stable outlet, inputs, training, financing.	Higher income, professionalisation.
Cooperatives, unions & federations	Aggregation, collective discipline, quality control.	Economic weight, credibility, access to market and credit.	Organised value chains, better governance.
Processors & agro-industrials	Industrial capacity, demand, investment.	Regular & compliant supply, lower logistics cost, export access.	Better-used industrial tool, competitiveness.
Buyers, brokers & importers (off-takers)	Contracts, outlets, market information.	Reliable volumes, traceable & compliant products.	Secured supply, expanded markets (AfCFTA, export).
Banks & donors	Financing, guarantees.	Bankable projects, controlled risk, traceability (COBAC).	Agricultural financing, impact portfolio.
State & line ministries	Regulatory framework, policies, approvals.	Structured value chains, revenue, food security, compliance.	Food sovereignty, sector development.
Municipalities & local authorities	Territorial anchoring, land facilitation, local relay.	Economic activity, local jobs, territorial dynamism.	Local development, social cohesion.
XP-NOVA — engineer of the system	Engineering, structuring, securing, 6-phase method.	Engineering and design-supervision mandates.	Bankable, high-performing, export-ready value chains.

6. The challenge families addressed

The PACTE model addresses the structural bottlenecks of the agropastoral sector not through isolated measures but through an integrated architecture. The table below links each challenge to the pillar(s) that answer it.

Family	Main challenges	PACTE response
Agriculture	Mechanisation glass ceiling · post-harvest losses & logistics deficit · fragmented supply & cooperative trust crisis.	P (frugal mechanisation) · A (Hubs, cooperatives) · T (cold chain).
Livestock	Land-use management & agropastoral conflicts · cost of zootechnical inputs & animal health · lack of cold chain & industrial slaughter.	A (territorial securing) · P (inputs, health) · T (abattoirs, cold).
Cross-cutting — Factors	Land insecurity · labour disaffection & ageing · training & extension deficit.	A (land securing) · P (Agro-Practitioner, training).
Cross-cutting — Market	ESG compliance & export traceability (EUDR, HACCP) · bank & donor financing · logistics, transport & storage.	E (certification) · C (bankability, contracts) · T/A (Hubs, cold).
Cross-cutting — System	Institutional fragmentation & governance · research & technology transfer · information systems & monitoring · spatial planning · security & malicious risk.	PACTE architecture (chain governance) · C (market information) · ODT link (spatial planning).
Compliance & standards. EUDR (European Union) · HACCP · ISO 22000 (food safety) · digital traceability & geolocation · OHADA legal securing · bankability under COBAC regulation · donor ESG safeguards.		

7. Benefits by stakeholder & securing by XP-NOVA

Benefits — illustrative cases

+51% PRODUCER INCOME (COOPERATIVE)	−8% FACTORY-DELIVERED RAW- MATERIAL COST (AGRO- INDUSTRIAL)	o FCFA DIRECT CONTRIBUTION REQUIRED FROM THE MUNICIPALITY	48h FIRST RESPONSE ON YOUR FILE
---	---	---	--

Illustrative values from typical cases; the actual parameters (CAPEX, OPEX, revenue) are established in FCFA in a dedicated business plan, chain by chain, with its assumptions and sensitivity scenarios.

How XP-NOVA secures every step of the engagement

Step / pillar	Securing provided by XP-NOVA
Scoping & diagnosis	Value-chain diagnosis, stakeholder mapping, risk register, scoping note (6-phase method — Understand).
Produce / Aggregate	Cooperative structuring, Agro-Practitioner status, Hub engineering, land and territorial securing.
Commercialise	Off-taker contracting, market-information access, framing of volumes and prices.
Transform	Design and supervision of transformation Hubs, cold chain, digital traceability.
Export	EUDR / HACCP / ISO 22000 compliance, origin documentation, certification support.
Financing	Business plan & financial model (FCFA), bankability note, OHADA/PPP structuring, donor & bank mobilisation.
Monitoring & impact	Monitoring & evaluation framework, indicators, ESG impact measurement, donor reporting.
